

# *Financial Incentives to Retirement in Belgium: What Policy Lessons?*

Alain Jousten      Ekaterina Tarantchenko

HEC-Management School, University of Liège, Belgium

International Microsimulation Meeting

October 23-24, 2014

- Focus of the study
  - ▷ role of the Belgian social security system in the retirement behaviour
  
- Contribution to the literature
  - ▷ simulation model based on rich administrative data containing career and earnings histories at individual level → **accurate approximation of social security benefits**
  - ▷ econometric model takes into account the potential **eligibility** for early retirement

- Initial sample: 100,000 individuals randomly drawn from the *entire* Belgian population
  - ▷ administrative source
  - ▷ 2001 income year
  
- Final sample: 3,343 individuals
  - ▷ wage earners' insurance scheme only
  - ▷ detailed career & earnings histories
  - ▷ 50-64 age range
  - ▷ employed at the end of Q1 of 2001

## Step 1 Construct social security incentive measures

- Financial

- ▷ net present discounted value of lifetime social security benefits = SSW (Social Security Wealth)
  - including unemployment, sickness/disability, conventional early retirement and pension benefits
- ▷ one year accrual in SSW (Social Security Accrual) & maximum accrual in SSW (Peak Value)

- Eligibility

- ▷ identifies who is potentially eligible for the standard or conventional early retirement

## Step 2 Estimate probit: effect of the *financial & eligibility incentives* on the retirement probability

## Step 3 Based on the estimation results, analyse the effect of hypothetical policy reform that changes the incentives and/or the eligibility

# Estimation results

(1) Financial incentives: not statistically significant (except SSA for women but has unexpected sign)

(2) Eligibility: strong positive impact

↔ Retirement decision is driven by the eligibility, rather than the financial incentives

- Simulated policy reform = simultaneous increase in
  - ▷ Conventional early retirement minimum age (58 → 60) & career years requirement (25 → 40)
  - ▷ Standard early retirement minimum age (60 → 62) & career years requirement (28 → 40)
- Impact on the predicted median retirement age at 50 years old
  - ▷ Men: 58.1 → 59 (+ 11 months)
  - ▷ Women: 58.6 → 59.5 (+ 11 months)

Thank you for your attention!
