# The case of operatic singers - Definition

# The case of operatic singers - Evaluation

## Musical errors – Conclusions

- Interval deviations
- + number of modulations if you are an expert

### BUT...

- Singing voice: Never perfect!
- Does not mean that the performance is “out of tune”

→ Limit between “in” and “out” of tune?

→ Is it consistent?

# In tune versus out of tune

## **Listeners' tolerance**

In preparation

# Tolerance

(Deviation, in cents)

# Tolerance - Background

(Deviation, in cents)

**Less than 50 cents**

- Studies on pitch discrimination
- Online tests

# Tolerance - Background

(Deviation, in cents)

**50 cents**

- Measurement of performances

Hutchins & Peretz (2012)

Pfordresher and Mantell (2014)

- Pitch perception

Huthins, Roquet, & Peretz (2012)

Warrier & Zatorre (2002)

# Tolerance - Background

(Deviation, in cents)

**100 cents**

- Musical conventions
- Measurement of performances
  - Berkowska & Dalla Bella (2009)
  - Dalla Bella, Giguère, & Peretz (2007)
  - Pfordresher et al. (2007, 2009)
- Pitch perception
  - Burns & Wards (1978)
  - Zarate, Ritson, & Poeppel (2012)

# Tolerance - Background

## More than 100 cents

- Measurement of performances
- Pitch perception

→ Only for highly trained voices

Larrouy-Maestri et al. (2014)  
Sundberg et al. (1996, 2013)  
Vurma & Ross (2006)

# Tolerance - Procedure

## Methods of limits

Van Besouw, Brereton, & Howard (2008)

# Tolerance - Material

## Exp1. Contour and type of error

## Exp 2. Size and position of the interval

## Exp 3. Familiarity (and expertise of the listener)

399 participants from 13 to 70 years old  
( $M = 29.81$ )

Familiarity ratings:  $t(398) = 20.92, p < .001$

# Tolerance - Results

## Exp1. Contour and type of error

n = 30 non musicians

No effect of Error type  
 $f(1, 114) = 1.74, p = .19$   
 No effect of Interval direction  
 $f(1, 114) = 0.68, p = .42$   
 No interaction  
 $f(1, 114) = 0.01, p = .98$

→ **Consistent**

## Exp 2. Size and position of the interval

n = 28 non musicians

No effect of Size  
 $f(1, 108) = 0.19, p = .66$   
 No effect of Position  
 $f(1, 108) = 0.55, p = .82$   
 No interaction  
 $f(1, 108) = 0.003, p = .96$

→ **Consistent**

## Exp 3. Familiarity (and expertise)

n = 30 non musicians  
 30 musicians

Effect of expertise  
 $f(1, 116) = 139.11, p < .001, \eta^2 = .54$   
 No effect of familiarity  
 $f(1, 116) = 2.74, p = .10$   
 No interaction  
 $f(1, 116) = .60, p = .44$

# Tolerance – Conclusions

- Low tolerance (25-40 cents)
- Particularly for music experts (~ 10 cents)
- Consistency of the tolerance, whatever the familiarity, contour, type of error, size, position

→ How pitch accuracy is perceived?

In tune versus out of tune  
**On the process of accuracy  
perception in melodies**

Larrouy-Maestri P., Franz S., & Poeppel D.  
In progress

# Process - Background

## Categorical perception

Transformation of varying sensory signals into categorical internal representations

## Continuous perception

Perception (sometimes linearly) of the variation of sensory signals

General: Harnard, 1987; Goldstone & Hendrickson, 2010 (review); Liberman et al., 1957

Use of labels: Maier, Glage, Hohlfeld, Rasha, Rahman, 2014 (review)

In music: Burns & Ward, 1978; Burns & Campbell, 1994; McDermott et al., 2010; Siegel & Siegel, 1977;

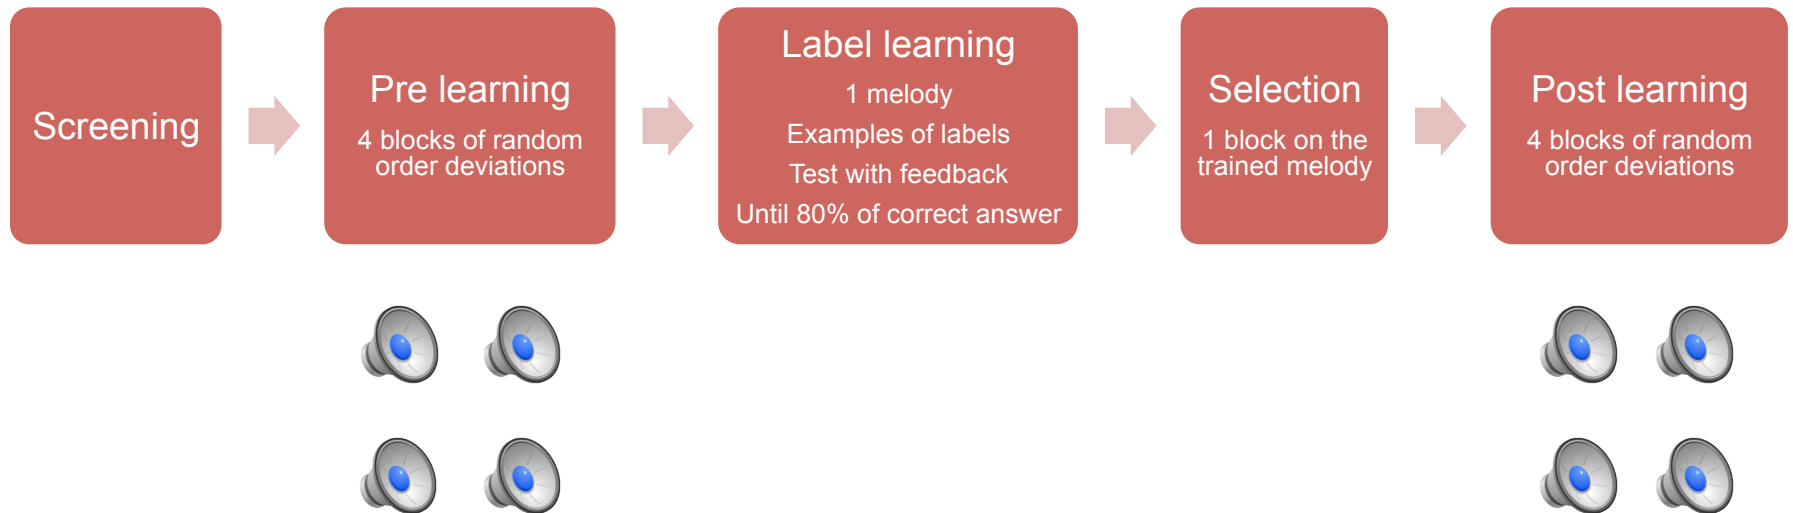

Zarate, Ritson, & Poeppel, 2012

# Process - Material

# Process - Procedure

1. Identification task

In-tune

Out-of-tune

2. Confidence level

0

1

2

3

# Process – Effect of learning (n = 25)

# Process – Identification task (n = 20)

## No effect of

- Formal musical training
- Informal musical training
  - Active/passive listening
  - Concerts
- Difficulty of the task
- Enjoyment of the voice

# Process – Confidence task (n = 20)

## Process – Conclusion (provisory)

**→ Combination of categorical and continuous perception when listening to melodies**

1. Individual differences regarding the mechanism
  - Development
  - Disorders
2. Similar conclusions in other domains
  - Relevant comparison(s)
